Drawbacks of Numerical Solutions

A Black Box

- Can Construct Solution to Model Without Really Understanding It
- Hard Even To Be Sure Your Numerical Solution Is *Right*
- Little Intuition for How Results Might Change With
 - Calibration
 - Structure
- *Very Hard To Teach!*

I Am A *Big* Fan Of Numerical Methods

- Have Done A Good Deal Of Work With Them Myself
- But As A Result, Have Felt All These Drawbacks Keenly

The Gap This Paper Fills

Foundations For Microeconomic Household's Problem With

- Uncertain Labor Income
- No Liquidity Constraints
- CRRA Utility
- (Problem with Liquidity Constraints Is A Limiting Case)

The Gap This Paper Fills

Foundations For Microeconomic Household's Problem With

- Uncertain Labor Income
- No Liquidity Constraints
- CRRA Utility
- (Problem with Liquidity Constraints Is A Limiting Case)

Key Result

Restrictions On Parameter Values Such That

- Problem Defines A Contraction Mapping
 - $\Rightarrow \exists$ A Unique Consumption Function $c(m)$
- There Is A 'Target' Ratio Of Assets to Permanent Income
 - Requires A Key 'Impatience' Condition To Hold
 - Good News
 - Condition Is Weaker (Easier To Satisfy) Than Previous Papers Imposed

Limit as horizon T goes to infinity of

$$\begin{aligned} a_t &= m_t - c_t \\ b_{t+1} &= a_t R \\ p_{t+1} &= p_t \underbrace{\Gamma^{\psi_{t+1}}}_{\equiv \Gamma_{t+1}} \\ m_{t+1} &= b_{t+1} + p_{t+1} \xi_{t+1}, \end{aligned} \tag{1}$$

$$\xi_{t+n} = \begin{cases} 0 & \text{with probability } \wp > 0 \\ \theta_{t+n}/(1 - \wp) & \text{with probability } (1 - \wp) \end{cases} \tag{2}$$

- $u(\bullet) = \bullet^{1-\rho}/(1-\rho)$; $\mathbb{E}_t[\psi_{t+n}] = \mathbb{E}_t[\xi_{t+n}] = 1 \ \forall \ n > 0$; $\beta < 1, \rho > 1$

Surely This Problem Has Been Solved?

No.

- Can't Use Stokey et. al. theorems because CRRA utility
- Lit thru ? Can't Handle Permanent Shocks
- Must Use Boyd's 'Weighted' Contraction Mapping Theorem
- Surprisingly Subtle

Fortunately, the Conclusions Are Simple!

Benchmark: Perfect Foresight Model

Definitions:

Absolute Patience Factor

$$\mathbf{P} = (R\beta)^{1/\rho}$$

Return Patience Factor

$$\mathbf{P}_R = \mathbf{P}/R$$

Perfect Foresight Growth Patience Factor

$$\mathbf{P}_\Gamma = \mathbf{P}/\Gamma$$

Name	Condition	Implication
(AIC) Absolute Impatience Condition	$\mathbf{P} < 1$	$c \downarrow$ over time
(RIC) Return Impatience Condition	$\mathbf{P}_R < 1$	$c/a \downarrow$ over time
(PFGIC) Growth Impatience Condition	$\mathbf{P}_\Gamma < 1$	$c/\mathbf{p} \downarrow$ over time

When Does A Useful Limiting Solution Exist?

Finite Human Wealth (FHWC) condition:

$$\Gamma < R \quad (3)$$

Return Impatience Condition:

$$\mathbb{D}_R < R \quad (4)$$

When Does A Useful Limiting Solution Exist?

Finite Human Wealth (FHWC) condition:

$$\Gamma < R \quad (3)$$

Return Impatience Condition:

$$\mathbb{D}_R < R \quad (4)$$

What If There Are Liquidity Constraints?

- FHWC is *not* necessary for solution to exist
- Other Key Condition For Useful Solution is
'Perfect Foresight Finite Value of Autarky Condition (PFFVAC)':

$$\beta \Gamma^{1-\rho} < 1 \quad (5)$$

- Without RIC , Constraints Are Irrelevant
 - Because Wealth Always Wants To Rise, So Constraint Never Binds

What If There Are Liquidity Constraints?

- FHWC is *not* necessary for solution to exist
- Other Key Condition For Useful Solution is
'Perfect Foresight Finite Value of Autarky Condition (PFFVAC)':

$$\beta \Gamma^{1-\rho} < 1 \quad (5)$$

- Without RIC , Constraints Are Irrelevant
 - Because Wealth Always Wants To Rise, So Constraint Never Binds

Liquidity Constraints and Uncertainty

- Introduce permanent shocks to income
- Finite Value of Autarky Condition Becomes

$$\overline{\beta \Gamma^{1-\rho}} < 1 \quad (6)$$

$$\beta < \overline{\Gamma^{\rho-1}}$$

Contraction Mapping Requirements

Finite Value of Autarky Condition: Same As In Liq Constr Problem!

$$\overbrace{\beta \underline{\Gamma}^{1-\rho}} < 1 \quad (7)$$

$$\beta < \underline{\Gamma}^{\rho-1}$$

'Weak Return Impatience Condition' (WRIC)

$$0 \leq \beta^{1/\rho} \underline{\Gamma} < 1 \quad (8)$$

Requirement For Existence Of A Target

Definitions: 'Uncertainty-Adjusted' Growth:

$$\underline{\Gamma} = \Gamma_{\underline{\psi}} \quad (9)$$

Adjusted Growth Patience Factor:

$$\mathbf{P}_{\underline{\Gamma}} = \mathbf{P} / \underline{\Gamma} \quad (10)$$

$$= \bar{\phi} \mathbf{P}_{\Gamma} \quad (11)$$

$$= \mathbb{E} \left(\frac{\mathbf{P}}{\Gamma_{\psi}} \right) \quad (12)$$

Growth Impatience Condition:

$$\mathbf{P}_{\underline{\Gamma}} < 1 \quad (13)$$

Why? Because it can be shown that

$$[m_{t+1}]$$

Five Propositions

- 1 $\lim_{m_t \rightarrow \infty} \mathbb{E}_t[c_{t+1}/c_t] = \mathbf{P}$
- 2 $\lim_{m_t \rightarrow 0} \mathbb{E}_t[c_{t+1}/c_t] = \infty$
- 3 \exists a unique target value of m , called \check{m}
- 4 $\mathbb{E}_t[c_{t+1}/c_t | m_t = \check{m}] = \Gamma - \epsilon$
- 5 $\left(\frac{d\mathbb{E}_t[c_{t+1}/c_t]}{dm_t} \right) < 0$

The Target Saving Figure

Bounds On the Consumption Function

The Marginal Propensity to Consume

The Consumption Function and Target Wealth

Convergence To The Invariant Distribution

? Proves Existence of an Invariant Distribution of m, c, a , etc.

Balanced Growth Equilibrium

Achieved When Cross Section Distribution Reaches Invariance

$$Y_{t+1}/Y_t = C_{t+1}/C_t = \Gamma \quad (15)$$

Fisherian Separation Fails, Even Without Liquidity Constraints!

Insight:

- Precautionary Saving \approx Liquidity Constraints
- If $\tilde{c}(m)$ is solution for constrained consumer,

$$\lim_{\varphi \downarrow 0} c(m; \varphi) = \tilde{c}(m) \quad (16)$$

Balanced Growth Equilibrium

Achieved When Cross Section Distribution Reaches Invariance

$$Y_{t+1}/Y_t = C_{t+1}/C_t = \Gamma \quad (15)$$

Fisherian Separation Fails, Even Without Liquidity Constraints!

Insight:

- Precautionary Saving \approx Liquidity Constraints
- If $\hat{c}(m)$ is solution for constrained consumer,

$$\lim_{\varphi \downarrow 0} c(m; \varphi) = \hat{c}(m) \quad (16)$$

Balanced Growth Equilibrium

Achieved When Cross Section Distribution Reaches Invariance

$$Y_{t+1}/Y_t = C_{t+1}/C_t = \Gamma \quad (15)$$

Fisherian Separation Fails, Even Without Liquidity Constraints!

Insight:

- Precautionary Saving \approx Liquidity Constraints
- If $\hat{c}(m)$ is solution for constrained consumer,

$$\lim_{\varphi \downarrow 0} c(m; \varphi) = \hat{c}(m) \quad (16)$$

The MPC Out Of Permanent Shocks

<http://econ.jhu.edu/people/ccarroll/papers/MPCPerm.pdf>

Lots of Recent Papers Trying to Measure the MPCP

Paper Proves:

- $MPCP < 1$
- But not a lot less:
 - 0.75 to 0.95 (annual rate) for wide range of parameter values

- Defined Conditions Under Which Widely Used Problem Has Solution
 - Finite Value of Autarky Condition Guarantees Contraction (with WRIC)
 - Growth Impatience Condition Prevents $m \rightarrow \infty$
- Economy Of Buffer Stock Consumers Exhibits Balanced Growth
 - Even In Absence of General Equilibrium Adj of Interest Rate
